

## Why Is My Surgeon Using an Allograft?

Your surgeon has determined that the use of an advanced placental-based allograft will be beneficial in your surgical procedure. Placental-based allografts are derived from donated human birth tissue. Sheet allografts provide a protective barrier or environment to support the healing process. Particulate allografts are used in the replacement or supplementation of damaged or inadequate underlying tissue.

## Where are placental-based allografts used?

Surgeons use placental-based allografts as an advanced treatment from head to toe in various types of wounds and surgical repairs or replacements.

## Where do placental-based allografts come from and how are they processed?

Placental-based allografts come from birth tissue that is donated from healthy, consenting mothers in the United States who have given birth by Caesarean section. To ensure the safety of the allografts, every tissue donor is tested for infectious diseases. The tissue then undergoes a specialized process that entails preservation and sterilization.

## What benefits have been reported with the use of placental-based allografts?

Clinical studies have shown the following benefits with the use of placental-based allografts (amnion/chorion) when used as a protective barrier to support the healing cascade:

- Faster recovery after surgery<sup>1-5</sup>
- Reduced surgical complications<sup>6-8</sup>
- Higher wound closure & limb salvage rates<sup>1,2,9,10</sup>
- Low fibrosis rates and improved cosmesis<sup>11-14</sup>

## Applications From Head to Toe in Many Types of Surgery

### AMNIOFIX®

Derived from Amnion and Chorion Tissues  
*Available in sheets and fenestrated sheets*

### AMNIOEFFECT®

Derived from Amnion, Intermediate Layer, and Chorion Tissues

### AMNIOCORD®

Derived from Umbilical Cord Tissue

### AXIOFILL® ECM PARTICULATE

Derived from Placental Disc Tissue
